

Testing and documentation on how the works.

Clicking on the first icon on the left triggers a pop-up where the user can select a visualization. By default, the Weather Visualization will appear when the app loads. From this pop-up, the user can choose a different visualization. **Important Note:** This feature relies on a free API, which may occasionally fail. If this happens, the system will default to coordinates near The City of Westminster, U.K. The reliability of the API is beyond our control.

Here is an example of the pop up open.

When using the Weather Visualizer, the user can either select their **Current Location** or choose from a predefined list of cities.

If the user selects **Quote Visualization**, they will see a display of quotes instead of weather data.

Clicking on the second icon from the left triggers the **Playlist** pop-up.

Within this pop-up, the user will see a default playlist containing two tracks.

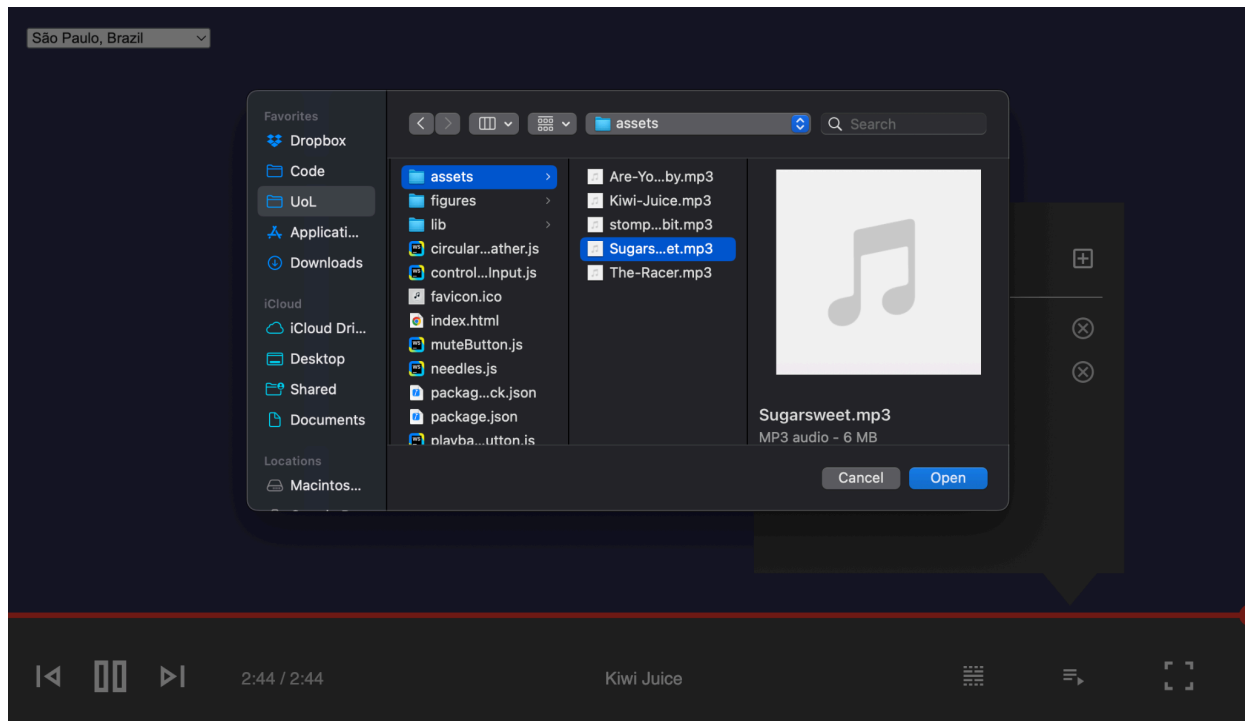

Clicking on any track will start playback.

Clicking the plus (+) icon in the square opens a modal where the user can upload an audio file.

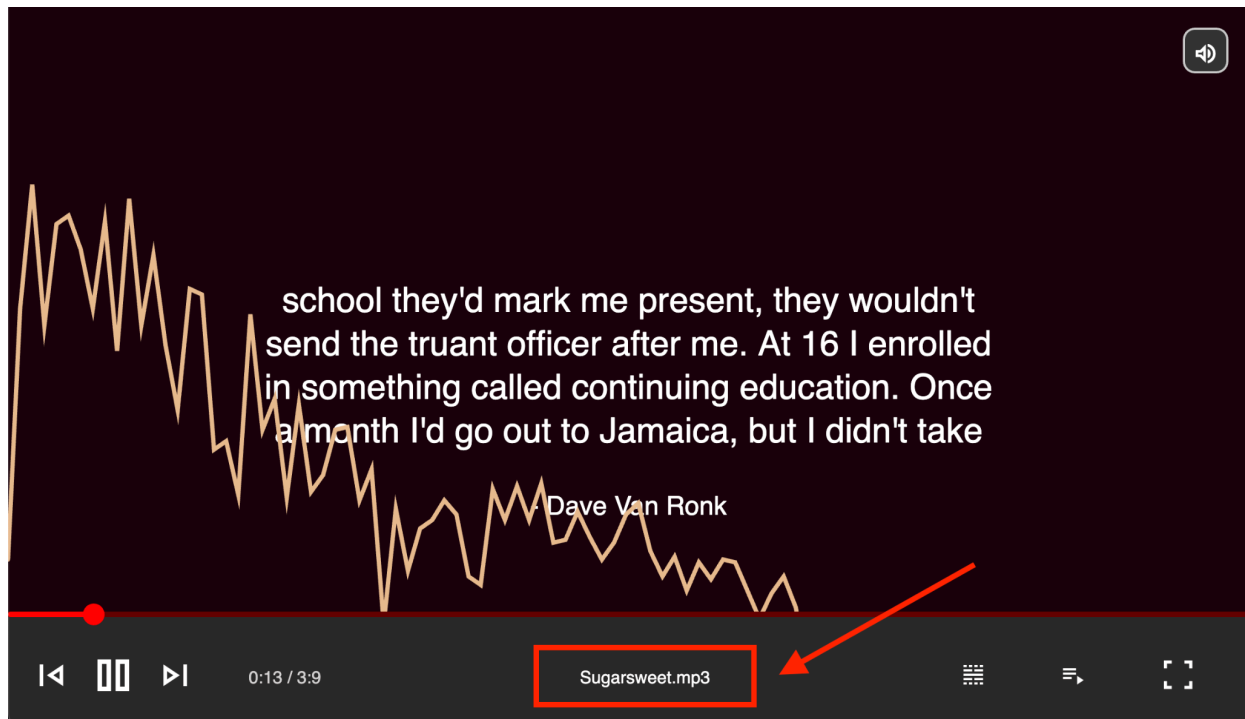

After selecting a file from their computer, the uploaded track will be added to the playlist.

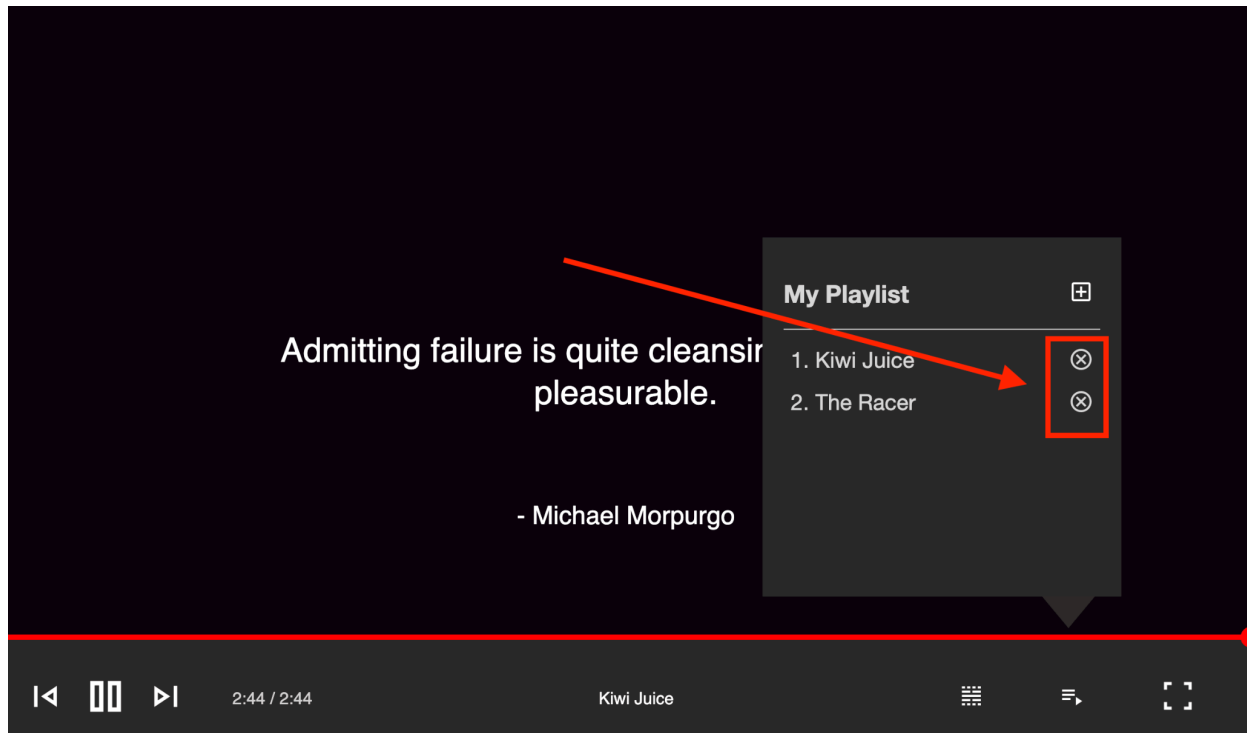

Once uploaded, clicking on the new track will start playback.

It will start to play.

The **Remove Track** feature allows users to delete individual tracks from their playlist. Each track in the playlist has a corresponding **✖ (remove) button** to its right. Clicking this button will immediately remove the selected track from the list. This action is irreversible, meaning the user will need to re-upload the track if they wish to add it back. The updated playlist will reflect the change instantly, ensuring a seamless user experience. If the removed track was currently playing, the next available track will start automatically, or playback will stop if no tracks remain.

Clicking the last icon on the right enters full-screen mode.

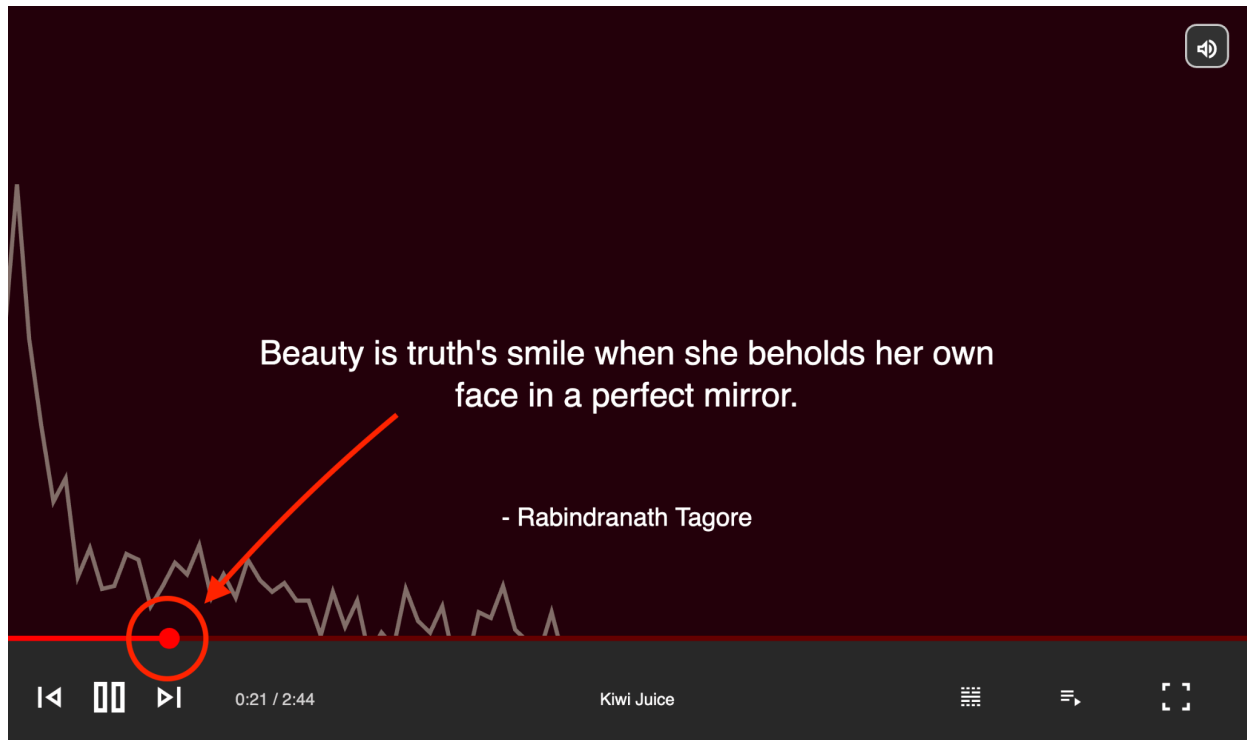

In full-screen mode, the visualization expands to cover the entire screen, and the player bar will be hidden. To exit full-screen mode, the user can press the Escape key, returning the app to its normal view.

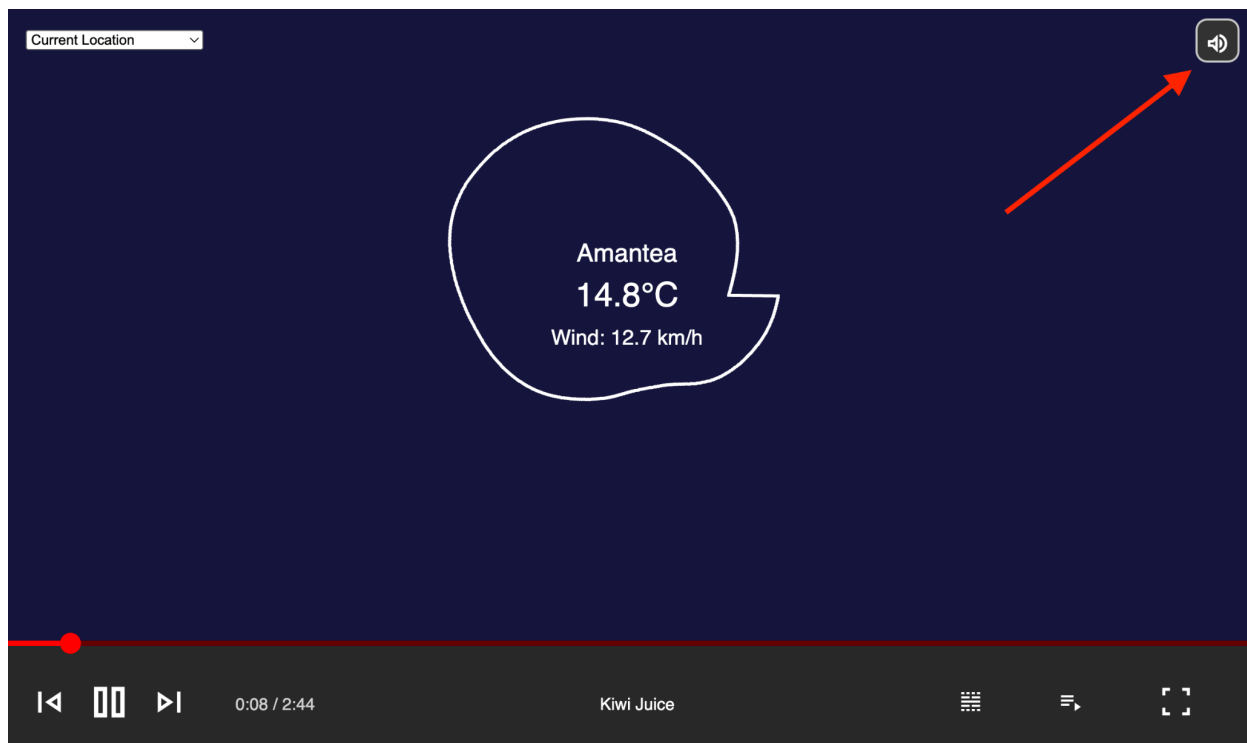

To **scrub** through an audio track, the user can **drag the seek bar knob** to adjust the playback position. Alternatively, they can watch the seek bar progress as the track plays.

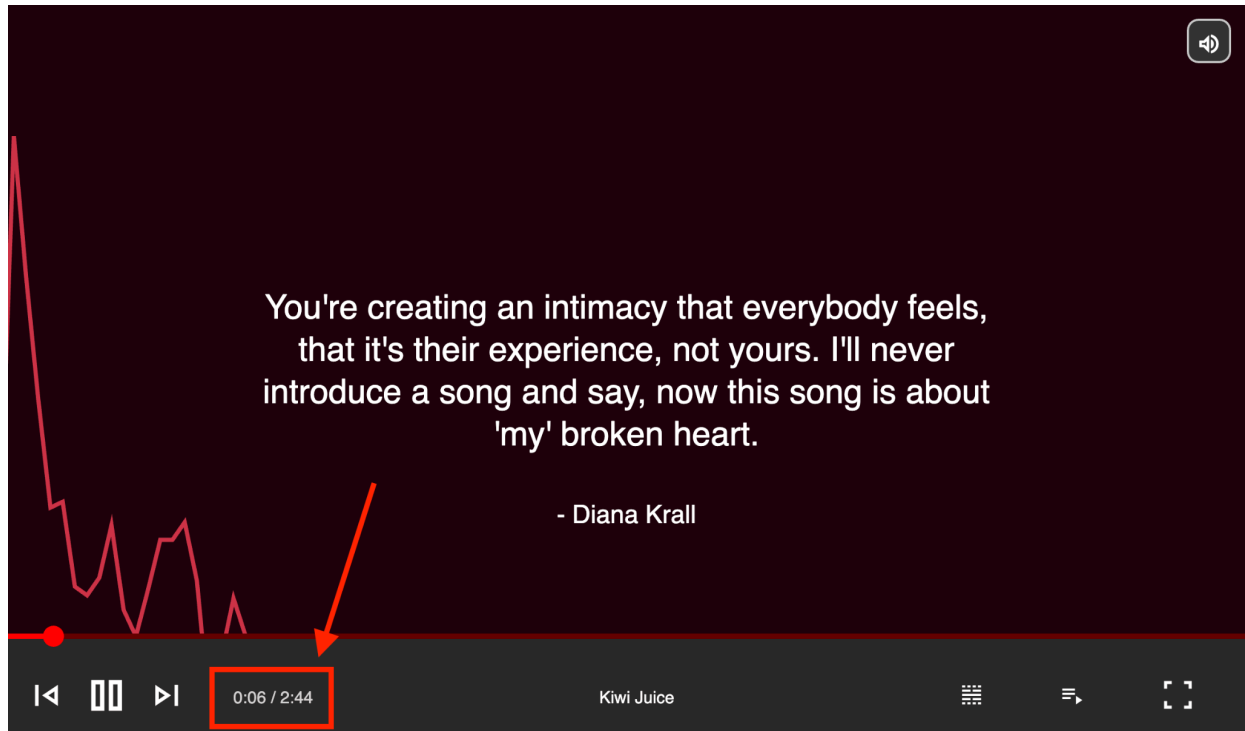

To mute the audio, the user can click the speaker icon.

The speaker icon will visually toggle to indicate mute status. Important Note: Muting the track does not pause playback; it only silences the audio.

The elapsed time display should accurately reflect the current playback position of the track, updating in real-time as the audio progresses. It should be formatted as minutes:seconds (MM:SS) and positioned alongside the total track duration for easy reference. The elapsed time should increment every second, ensuring smooth synchronization with the seek bar. If the user scrubs to a different part of the track, the displayed time should update immediately to reflect the new position. Additionally, if playback is paused, the elapsed time should remain static until the track resumes.

The **Previous**, **Play/Pause**, and **Next** controls allow users to navigate through their playlist efficiently. The **Previous button** moves playback to the start of the current track, and if pressed again within a short time, it will skip to the previous track in the playlist. The **Play/Pause button** toggles playback clicking it will start or pause the track while maintaining the current position. The **Next button** skips forward to the next track in the playlist. These controls provide an intuitive way to manage playback, ensuring a seamless listening experience.

If you must be mad, be it not for the things of the world. Be mad with the love of God.
